RIGHT CARE INITIATIVE Clinical Quality Improvement Leadership Collaborative

Right Care Initiative Statewide Goal: Drive Toward Zero Preventable Heart Attack, Stroke, Diabetes, and Heart Failure Deaths & Disabilities Through Best Available Science Combined with Proactive Screening and Outreach

Achieve 80% in good control, or “A Grade” (90th Percentile) HEDIS levels for Cardiovascular Disease and Diabetes, whichever is greater.

Priorities:
- 80% of hypertensive patients with blood pressure (BP) controlled: <140/90 mm Hg (Optimally 130/80 mm Hg per 2017 American College of Cardiology Guidelines, endorsed by ACC/AHA/APA/ABC/ACPM/AGS/APhA/ASH/ASPC/NMA/PCNA)
- 80% of diabetic patients with blood sugar controlled: Hemoglobin A1c<8
- 80% of patients with diabetes and/or cardiovascular conditions on appropriate cholesterol therapy (proxy, LDL controlled: LDL-C<100mg/dL)

Proactive Community Outreach to Screen & Identify Vulnerable Patients to Connect to Treatment & Support

Activities:
- University of Best Practices (UBPs) have been built in four metropolitan areas to share learning and encourage adoption of evidence-based interventions for preventing and better managing premature heart attacks, strokes, diabetes and heart failure. Practical presentations from benchmark performers are geared toward medical, pharmacy and quality improvement directors to spur achievement of national “A-grade” performance and better disease management.
- Regularly highlight progress on HEDIS & P4P performance data, examine new OSHPD hospitalization data, promote adoption of strategies used by top performers, and recognize superior performance.

Contact: Hattie Rees Hanley, MPP, Right Care Initiative Director, hattlehanley@berkeley.edu; Research & Logistics: Meaghan Olson (510-680-0271) meolson17@berkeley.edu, Jenny Woo (510-549-6157) jennywoo@berkeley.edu

Key Partners: This collaborative, expert-based, data-driven project includes and has been supported by volunteers, resources, and leadership from:

- USHHS Million Hearts Initiative
- American Medical Group Assoc. Foundation
- American College of Cardiology, CA Chapter
- Med. groups, clinics, health plans & systems
- UC Berkeley School of Public Health
- University of California Schools of Public Health, Medicine, and Pharmacy
- RAND Corporation
- Stanford School of Medicine & Clinical Excellence Research Center
- USC Schools of Med., Pharmacy and Policy
- Blue Shield of California
- Sierra Health Foundation
- California Chronic Care Coalition
- Stroke Awareness Foundation
- No More Broken Hearts Foundation
- American Heart/Stroke Association
- American Diabetes Association
- Local Military and Veteran’s Health
- Integrated Healthcare Assoc. (P4P)
- Los Angeles County Dept. of Public Health
- California Department of Public Health
- CA Department of Managed Health Care
- CA Office of the Patient Advocate
- CA Office of Statewide Health Planning and Development
- Health Trust / Community Health Partnership
- Amarin Angen
- Boehringer-Ingelheim
- Genentech
- Johnson & Johnson
- Novo Nordisk

Objective: Reduce preventable death, disability and suffering from the high leverage areas of cardiovascular disease and diabetes through improved implementation of the best medical science to improve patient outcomes. Since 2007, The California Right Care Initiative collaborative has been working to catalyze the adoption of best practices deployed by top performers where metrics indicate that evidence-based practices are not deployed to the best advantage of patients, with particular emphasis on control of blood pressure, cholesterol and blood sugar (see Right Care Triangle page two).

Progress: The results of our first demonstration project were published in two articles as being associated with significant declines in heart attack hospitalizations. The first analysis estimated that during the first four years of our NIH-funded pilot project there were 2,735 fewer heart attack hospitalizations than would have been anticipated based on secular trend (Fulton et al. American Journal of Managed Care, Oct. 2017). The second analysis included two more years of data, and estimated a sustained 22% reduction in acute myocardial infarctions hospitalizations, a decline of 3,826 fewer heart attack hospitalizations than anticipated based on secular trend over six years (Fremont et al. Health Affairs, Sept. 2018). The Health Affairs analysis further estimated that if our initial pilot results were spread statewide, $935 million would be saved between 2011 and 2016 and over 42,000 acute myocardial infarction hospitalizations would have been prevented.

Challenge: 2017 data from the California Office of Statewide Health Planning and Development indicate that annually approximately 298,000 Californians are hospitalized for heart attacks and strokes, approximately 100,000 of them younger than age 65. According to the US Centers for Disease Control, in 2017, 94,343 California deaths were caused by heart disease, stroke, diabetes, and hypertension (62,797; 16,355; 9,595; 5,596 respectively). These conditions are strongly linked to one another, and many of these deaths are preventable. NCQA conservatively estimates that improving California’s cardiovascular disease and diabetes measures to the national HEDIS 90th percentile could save 1,694 to 2,818 CA lives each year, while avoiding $118 million in yearly hospital costs, 766,401 sick days and $125.56 million in lost productivity. Heart disease, hypertension and diabetes are increasingly well understood scientifically, and ripe for best practices collaboration. The foundation of our work is publicly available data from the US Centers for Disease Control, the California Department of Public Health, the CA Office of the Patient Advocate, the CA Office of Statewide Health Planning and Development, the Integrated Health Care Association, the National Committee For Quality Assurance, the federal Agency for Health Care Quality and Research, and the Commonwealth Foundation, among others. Over the course of this project, California has outpaced the nation in improving health system performance on control of blood pressure, cholesterol and blood sugar, building on the “100,000 Lives” campaign for reducing medical errors and the Million Hearts™ national initiative launched in 2011.
Promising Interventions to Reach Right Care Control Targets for Heart Attack, Stroke, and Diabetes Prevention and High Quality Management

**Patient Activation**
- Stress reduction, medication adherence, healthy sleep, nutrition & physical activity, smoking cessation
- Evidence-based patient education (e.g., Project DULCE; Stanford Patient Self-Management)
- Motivational interviewing and evidence-based media messaging

**Clinical Pharmacists on Care Team**
- CA Dept. Public Health White Paper
- HRSA.gov/patientsafety

**Protocols**
- Nationally Endorsed Guidelines (ACC, AHA)
- NICE UK (eg. chest pain)
- Bundled Medication Therapy (Aspirin, Statin, Hypertension Agents)

**Intensive Ambulatory Care**

**Implementation Action:**
The Right Care Initiative, operated by the UC Berkeley School of Public Health, was publicly launched with encouragement from the Department of Managed Health Care, NCQA and the Deans of UC Berkeley and UCLA Schools of Public Health in March 2008 at the 1st annual Clinical Quality Improvement Leadership Summit. Since then, more than a dozen Right Care site meetings have been held around the state, along with over 200 monthly University of Best Practices. Each Right Care gathering is a collaborative effort to close the gap between scientific practice to improve patient outcomes working with medical directors, pharmacy and quality improvement directors, as well as thought leaders in evidence-based medicine.

**State-Wide Right Care Technical Expert Group:**
- Stephen Shortell, PhD, MPH, MBA, Technical Expert Group Chair, Dean Emeritus and Prof., School of Public Health, UC Berkeley; Robert M. Kaplan, PhD, Research Director, Stanford University Clinical Excellence Research Center; Hector Rodriguez, PhD, MPH, Prof., Health Policy and Management, School of Public Health, UC Berkeley; Director, Center for Healthcare Organizations and Innovation Research; William J. Bommer, MD, FACP, FACC, Statewide Chairman, Right Care Initiative; Society Delegates, California American College of Cardiology and California Medical Association; Director, California ePCI Program; Director, Prevention Forward Program and Professor of Medicine, Division of Cardiovascular Medicine, University of California, Davis; Steve Chen, PharmD, FASHP, FCSPH, FNAP, Associate Dean for Clinical Affairs, USC School of Pharmacy; Keith Emmons, MD, Medical Director, CenCal Health of Santa Barbara (Medi-Cal plan); Scott Flinn, MD, University of Best Practices Co-Founder; Medical Director, Blue Shield of California; Former Navy Undersea Medical Officer with the Navy SEALs; Cindy Giambonne, PharmD; co-chair, Right Care Initiative Heart Failure Work Group; Director, Performance Improvement and ACO Pharmacy Risk, MemorialCare Foundation and Medical Group; Jan D. Hirsch, RPh, PhD, Founding Dean, UC Irvine School of Pharmacy; David Joel Maron, MD, FACC, FAHA, Clinical Professor of Medicine, Chief, Stanford Prevention Research Center Director, Preventive Cardiology, Stanford University School of Medicine; John Ovretviet, Karolinska Institute, Stockholm, Sweden; Catrina Taylor, PhD, NSP, Senior Research Scientist, Epidemiologist/Biostatistician, Chronic Disease and Control Branch, California Department of Public Health

**Early Co-Founding Experts:**
- Arnie Milstein, MD, MPH, Professor of Medicine and Director, Clinical Excellence Research Center, Stanford University; Medical Director, Pacific Business Group on Health; Warren Barnes, JD, M.Div., Former Chief Lawyer, California Department of Managed Health Care, Minister and Co-Founder, Right Care Initiative; Allen Fremont, MD, PhD, Right Care Technical Expert Group 2008-2009; Co-Principal Investigator and Data Lead, Right Care NHLBI (2009-2012); Former Physician Policy Researcher and Director, RAND Q-DART Project, RAND Corporation; Helen Halpin, ScM, PhD, Professor Emerita and Former Director, Center for Health and Public Policy Studies, UC Berkeley School of Public Health; Jerry Penso, MD, MBA, President and Chief Executive Officer, AMGA (formerly the American Medical Group Association); Co-Founder, Right Care Initiative University of Best Practices.

**University of Best Practices:**
- Thanks to an NIH GO grant (2009-July 2012), the Right Care Initiative received a special opportunity to launch a community-focused effort to reach the Right Care Initiative goals of preventing heart attacks, strokes and diabetic complications and piloted the first University of Best Practices in San Diego (subsequently renamed Be There San Diego.) Since then, Right Care University of Best Practices has been launched in three additional metro areas: Sacramento in 2012, Los Angeles in 2013 and Bay Area Silicon Valley in 2018. Each University of Best Practices makes an effort to include the major delivery systems of the region, including medical groups, health plans, community clinics, local public health, military and VA medical leaders, together with patient advocacy groups and other subject matter experts.

**San Diego Be There University of Best Practices Co-Chairs:**
- Anthony DeMaria, MD, University of Best Practices Co-Founder & Chair; Former Editor in Chief, Journal of American College of Cardiology; Founding Director, UCSD Cardiovascular Center Prof., School of Medicine, UCSD; Parag Agnihotri, MD, Chief Medical Officer, Population Health Services at UC San Diego Health; R. James Dudi, MD, Former Diabetes Lead & Community Benefits, Kaiser Permanente

**San Diego County Office of the Public Health:**
- Be There University of Best Practices Co-Chairs: William J. Bommer, MD, FACP, FACC, Statewide Chairman, Right Care Initiative; Specialty Delegates, California American College of Cardiology and California Medical Association; Director, California ePCI Program; Director, Prevention Forward Program and Professor of Medicine, Division of Cardiovascular Medicine, University of California, Davis; Susan L. Ivey, MD, MHS, Co-Chair, Right Care Initiative Capital Region; Professor, Adjunct, School of Public Health, UC Berkeley; Director of Research, Health Research for Action; Joseph Sky, MD, FACP, FACC, Co-Chair, Right Care Initiative University of Best Practices; Chief of Preventive Cardiology, Assoc. Chief of Staff, David Grant Medical Center, US Air Force; Matthew P. Wonnacott, MD, Chief Medical Officer, Barton Health.

San Diego Be There University of Best Practices Co-Chairs: Anthony DeMaria, MD, University of Best Practices Co-Founder & Chair; Former Editor in Chief, Journal of American College of Cardiology; Founding Director, UCSD Cardiovascular Center Prof., School of Medicine, UCSD; Parag Agnihotri, MD, Chief Medical Officer, Population Health Services at UC San Diego Health; R. James Dudi, MD, Former Diabetes Lead & Community Benefits, Kaiser Permanente.

Bay Area Silicon Valley Right Care University of Best Practices Co-Chair and Steering Committee: Robert M. Kaplan, PhD, Research Director, Stanford University Clinical Excellence Research Center; Eveline Stock, MD, Assistant Prof., School of Medicine, University of California, San Francisco; Darrel K. Gardin, MD, National Coordinator, Department of Health and Human Services, Stanford University Cardiology, Cardiovascular Care & Prevention Center, Department of Medicine, University of California, San Francisco; Nirali Vora, MD, Associate Prof., School of Medicine, Stanford University; Director, Glaucoma Research Program, Blue Shield of California, Chief Medical Officer, Palo Alto Medical Foundation.

**Resources:**
- We wish to thank the Right Care Initiative supporters: The Sierra Health Foundation, RAND Corporation, Stanford University, The California Department of Public Health, Blue Shield, Stroke Awareness Foundation, No More Broken Hearts Foundation, Amarin, Amgen, Boehringer-Ingelheim, Genentech, Johnson & Johnson, and Novo Nordisk for enabling the research and logistical support at the University of California, San Francisco School of Public Health for the Right Care Initiative University of Best Practices and our clinical quality improvement leadership summits. A very special thank you to the National Institutes of Health / National Heart, Lung, and Blood Institute, and the Judith and Jack White Family for initial seed funding for the University of Best Practices!

**Last Updated:** February 2021 Page 2 of 35
The Right Care Initiative of UC Berkeley School of Public Health has worked since 2007 to improve clinical outcomes by catalyzing uptake of patient-centered, evidence-based best practices among medical groups, clinics, and health plans. This public-private partnership is led by UC Berkeley School of Public Health and was publicly launched collaboratively with UCLA School of Public Health and the CA Department of Managed Health Care in 2008. Our collaborative is comprised of physician and clinical quality improvement leaders, health systems, multiple UC campuses, USC, Stanford, RAND, public health officials, patients, and advocates such as the CA Chronic Care Coalition. With support from NIH for our first pilot, and with subsequent charitable funds, we built four regionally-focused University of Best Practices (UBP) starting in 2011: San Diego, Sacramento, Los Angeles and the Bay Area Silicon Valley. Our 4th UBP was launched in Bay Area Silicon Valley in 2018 to continue to spread best practices to prevent and better manage heart attacks, strokes, and diabetes by building on the sustained 22% reduction of heart attacks we have seen with our initial pilot. Our University of Best Practices focus on leaders from organizations with breakthrough clinical quality who share strategies to improve patient outcomes. Data from our first NIH funded pilot University of Best Practices is described here.

### University of Best Practices: Right Care’s Translational Model to Implement Evidence-Based Innovations
- Monthly 2+ hour convenings are held with leaders from major regional health care delivery systems and public health.
- Leaders from high-performing organizations and/or experts present “how they did it” along with lessons learned.
- A break-out session or discussion involving all participants follows to consider how to apply the speaker’s ideas in the local setting and to problem-solve overcoming barriers for improved patient outcomes.
- Trusted performance data is the bedrock of the UBP model.

### UBP Resources – A National Institutes of Health - Grand Opportunity (NIH-GO) grant, awarded in late 2009, supported the UC Berkeley, UCLA and RAND Right Care research teams to meet with individual San Diego delivery systems in 2010; supported hosting three separate day-long Right Care Initiative Scientific Summits in San Diego in 2010-2011; and launched the initial pilot University of Best Practices in San Diego in February 2011. When NIH-GO grant funds expired, Right Care Champions Judith and Jack White provided bridge funding to continue the San Diego UBP until new federal grant funds were obtained. Charitable contributions, grant funding, and membership contributions continue to support the regional University of Best Practices sites.

Since the introduction of the University of Best Practices in San Diego County in early 2011, there has been an observable decline in hospitalizations for adult heart attacks (myocardial infarction) when compared to the rest of California (see graphs below) (Fulton et al., 2017; Fremont et al., 2018). This is similar to trends seen in South Carolina where physician collaboratives across the state focused on fighting against heart disease. South Carolina efforts on better manage heart attacks, strokes, and diabetes by building on the sustained 22% reduction of heart attacks we have seen with our initial pilot. Our University of Best Practices focus on leaders from organizations with breakthrough clinical quality who share strategies to improve patient outcomes. Data from our first NIH funded pilot University of Best Practices is described here.

### Lessons Learned in Implementing University of Best Practices
- A collaborative, “non-combat zone” spirit among local clinical leaders is the essential ingredient, following the Warren principle: In this room we compete against disease, not against each other.
- High performing medical directors, coupled with cardiologist and endocrinology experts, co-lead the discussions and mentor others to achieve better outcomes.
- 75% or less of our gathering time is for presentations to allow for sufficient discussion on achievable, locally applicable action plans.
- Many hours of behind-the-scenes planning and organizing are needed for a successful collaborative.
- Enthusiastic participation is built on the quality of intellectual content.

### Figure 1: Hospitalizations per 100,000 Adult Population for Heart Attacks Comparing San Diego County with the rest of California, 2007-2014

**Source:** Fulton et al., 2015, analysis of California Office of Statewide Health Planning and Development’s 2007 to 2014 Patient Hospitalization Discharge Data

Notes: SD County = San Diego County; CA (ex. San Diego County)= California excluding San Diego County; Heart attacks (ICD-9-CM code 410.xx); UBP= University of Best Practices. UBP started in February 2011, just after the 2010 data points. Percentages are percent changes since 2010.

### Figure 2: Three-Year Average Age-Adjusted Death Rate for Coronary Heart Disease in San Diego County 2007-2016

**Source:** California Department of Public Health County Health Report 2011-2018

Notes: Coronary Heart Disease (CHD): ICD-10 codes I20-I25 as underlying cause of death.
The Right Care Initiative started statewide convenings in 2008, and with NIH support began planning focused implementation in San Diego County (SD) in 2010. Starting in 2011, SD medical groups were supported by RAND to have regular data sharing meetings (in addition to the NIH supported Right Care University of Best Practices) to drive improved control of LDL cholesterol, blood pressure, and HbA1c. Two figures below illustrate individual medical group performance in SD in controlling LDL cholesterol and blood pressure. Results from recent state report cards appear below. LDL 100 cholesterol and BP control in SD delivery systems outperformed California.

**Figure 3: LDL Cholesterol Control (<100 mg/dL) for People with Heart Disease. Note:** LDL data were no longer recorded in San Diego County after 2013.

**Figure 4: Blood Pressure Control (<140/90 mm Hg) for People with Diabetes. Note:** Data were not available for this measure until 2010.

### Looking Forward

Results and lessons learned from the University of Best Practices approach to prevention and better management of heart attacks, strokes and diabetic complications are being spread to UBPs in Los Angeles, Sacramento, Santa Clara County. Significant progress has been made toward the initial goal set by the steering committee of medical directors from the initial Right Care Initiative San Diego University of Best Practices (now renamed Be There San Diego) who came to consensus in 2011 that heart attacks could be reduced by 50% in 5 years by implementing the interventions on the Right Care Triangle (see triangle to right and Right Care Initiative Project Brief).

From 2011 to 2014, the hospitalization rate decrease in San Diego County was 16.5 percentage points more than the decrease in the rest of the state for peak attacks. If those results were achieved throughout the rest of California, there would have been approximately 5,000 fewer hospitalizations for heart attacks each year, saving over $100 million in annual payments to hospitals.

A September 2018 *Health Affairs* article indicated that if our initial pilot results were spread statewide, $935 million would be saved between 2011 and 2016 and over 42,000 acute myocardial infarction hospitalizations would have prevented.

Please see Press Release of *Health Affairs* study (Fremont et al., 2018) indicating a sustained 22% reduction in acute heart attack hospitalizations over 6 years in our initial pilot community: here.

### Building on the Shoulders of Giants

The Right Care Initiative launched the University of Best Practices pilot program in San Diego building on the conceptual learnings of collaboratives that had come before (Egan et al, 2011).

Note: In 2014, after NIH funding ran out, The San Diego UBP obtained independent funding and was renamed Be There San Diego University of Best Practices. Its goals and leadership by renowned cardiologist Anthony DeMaria, MD, remain unchanged.

---

* Additional resources can be found at: [www.RightCare.Berkeley.edu](http://www.RightCare.Berkeley.edu) The Right Care Initiative is acharitably funded collaborative operated by UC Berkeley School of Public Health, and was originally launched in collaboration with UCLA and the CA Department of Managed Health Care.

Coronary Artery Calcium Heart CT Screening for Early Detection of Atherosclerotic Plaque: Measuring Heart Attack Risk to Determine Need for Preventive Medication
Right Care Initiative Project Brief as of May 2019

Cardiovascular Disease Indicator: Coronary Artery Calcium is an Effective & Personalized Predictor of Cardiovascular Events

Heart attacks and strokes, the leading cause of death in the United States, strike without warning in approximately 50% of cases.1,2 They are often caused by plaque buildup in the walls of the arteries. The plaque usually includes calcium, which makes it visible on a CT scan. For this reason, it is possible to identify if plaque is present in the heart (coronary) arteries long before a heart attack strikes. Therefore, a CT scan of the coronary arteries is a means of screening for patients without symptoms who may be at high risk for a heart attack, refining clinical risk prediction and informing treatment decision-making to obtain better health outcomes and reduce costs. The presence of coronary artery calcification (CAC) increases the likelihood of having deposits in other arteries, including those that supply the brain. Therefore, finding coronary artery calcium may indicate an increased risk of stroke as well as heart attack. The 2018 joint guidelines issued by the American Heart Association (AHA) with the American College of Cardiology (ACC); and UK National Health Service guidelines, endorse this test to improve cardiovascular disease (CVD) risk classification and identify a group of individuals who receive major benefit from statins.3,4 Conventional risk factors of vascular disease that guide early detection include: family history, diabetes, elevated LDL cholesterol, low HDL cholesterol, tobacco use, hypertension, obesity/physical inactivity and stress. Measuring coronary artery calcium is a specific indicator of an individual's mortality risk that has proven to be a very effective predictor of risk, highly motivating for patients to be adherent to preventive medications & lifestyle changes, while being also cost-effective.5,6,7 Higher CAC scores are associated with higher risk and need for more intensive preventive intervention.8

---

**Notes:**

1. Heart attacks and strokes, the leading cause of death in the United States, strike without warning in approximately 50% of cases. They are often caused by plaque buildup in the walls of the arteries. The plaque usually includes calcium, which makes it visible on a CT scan. For this reason, it is possible to identify if plaque is present in the heart (coronary) arteries long before a heart attack strikes. Therefore, a CT scan of the coronary arteries is a means of screening for patients without symptoms who may be at high risk for a heart attack, refining clinical risk prediction and informing treatment decision-making to obtain better health outcomes and reduce costs. The presence of coronary artery calcification (CAC) increases the likelihood of having deposits in other arteries, including those that supply the brain. Therefore, finding coronary artery calcium may indicate an increased risk of stroke as well as heart attack. The 2018 joint guidelines issued by the American Heart Association (AHA) with the American College of Cardiology (ACC); and UK National Health Service guidelines, endorse this test to improve cardiovascular disease (CVD) risk classification and identify a group of individuals who receive major benefit from statins. Conventional risk factors of vascular disease that guide early detection include: family history, diabetes, elevated LDL cholesterol, low HDL cholesterol, tobacco use, hypertension, obesity/physical inactivity and stress. Measuring coronary artery calcium is a specific indicator of an individual's mortality risk that has proven to be a very effective predictor of risk, highly motivating for patients to be adherent to preventive medications & lifestyle changes, while being also cost-effective. Higher CAC scores are associated with higher risk and need for more intensive preventive intervention.

**Figure 9:** Myocardial Infarction (MI), Stroke or Death as Initial Presentation of Coronary Heart Disease

Coronary Artery Calcification CT Scan Priority Scanning Groups

American College of Cardiology and American Heart Association Cholesterol Clinical Practice Guidelines, 2018 (Grundy SM, et al.)

- In adults 40 to 75 years of age without diabetes mellitus and with LDL-C levels ≥70 mg/dl (≥1.8 mmol/L), at a 10-year ASCVD risk of ≥7.5%, start a moderate-intensity statin if a discussion of treatment options favors statin therapy. Risk-enhancing factors favor statin therapy. If risk status is uncertain, consider using CAC to improve specificity. If statins are indicated, reduce LDL-C levels by ≥30%, and if 10-year risk is ≥20%, reduce LDL-C levels by ≥50%.
- In adults 40 to 75 years of age without diabetes mellitus and with LDL-C levels ≥70 mg/dl-89 mg/dl (≥1.8-4.9 mmol/L), at a 10-year ASCVD risk of ≥7.5%-19.9%, if a decision about statin therapy is uncertain, consider measuring CAC. If the CAC score is zero, treatment with statin therapy may be withheld or delayed, except in cigarette smokers, those with diabetes mellitus, and those with a strong family history of premature ASCVD. A CAC score of 1-99 favors statin therapy, especially in those >55 years of age. For any patient, if the CAC score is ≥100 Agatston units or ≥75th percentile, statin therapy is indicated unless otherwise deferred by the outcome of clinician–patient risk discussion.

United Kingdom’s National Health Service Guidelines for Chest Pain Recommend Heart CT Scan for Chest Pain

- Updates to United Kingdom’s national guidelines for chest pain involve recommendations that “cardiac CT is the first-line investigation for patients presenting with new-onset chest pain due to suspected coronary artery disease because of the diagnostic accuracy and cost effectiveness.”
- “If a patient’s pre-test likelihood of significant cardiovascular disease was low (10–29%), a coronary artery calcium score was the recommended first-line investigation with subsequent CT coronary angiography if the calcium score was between 1 and 400 Agatston Units.”

The Importance of Coronary Artery Calcification Screening: Case Study

An asymptomatic 55-year-old white with unremarkable cardiovascular risk factors (no hypertension, no smoking, no diabetes, lipids: TC:222; TG:122; HDL:42; LDL:156; family history: father is alive at 78; had a myocardial infarction at 50 and 55; had CAB; athletic) presents a 10-year atherosclerotic cardiovascular disease (ASCVD) risk score of 6.6%. With this ASCVD risk score, providers may consider prescribing a statin or aspirin and discuss lifestyle management, however a coronary artery calcification scan shows a calcium score of 1153 (shown left). The risk factors described, taken with the calcium score, indicate that the patient is at high risk for cardiovascular disease and it is recommended that a statin and aspirin are prescribed along with intensifying lifestyle management.
**Take Action**

Stanford Health Care, LA BioMed in Los Angeles, UC Davis Health Preventive Cardiology and Gundersen Health System are lowering the barrier to receiving the coronary artery calcium scan as a preventive screening test by offering it to patients for a cash price of $150 to receive this precision prevention information for understanding patients’ actual risk profile.

### Occupational Use of Coronary Artery Calcification CT Scan

This scan is used as a tool in determining fitness for duty by predicting cardiovascular risk and yielding actionable information to prevent heart attacks and strokes.

- **The President of the United States**  
  - After President Clinton's heart attack, the Coronary Calcium CT Scan was added to presidential physicals to enable a more preventive approach to protecting the President's health. This test enables greater clarity on whether cardiovascular medications are needed, and at what dose, as well as needed lifestyle modifications.

- **Astronauts**  
  - Astronauts' medical assessments include calculating a 10-year cardiovascular Framingham Risk Score, measuring high-sensitivity C-reactive protein levels and **using coronary artery calcium scores** to screen for cardiovascular disease and decrease the likelihood of a crewmember experiencing a cardiac event during spaceflight.\(^{17}\)
  - The 2014 NASA Human Research Program Investigators' Workshop developed a tool **using CAC scores** along with other risk factors to calculate astronaut cardiovascular health and risk.\(^{18}\)

- **Firefighters**  
  - Cardiovascular disease contributes to 45% of on-duty fatalities and is the leading cause of on-duty death among firefighters.\(^{16}\)
  - Forward leading fire departments across the country, such as Los Angeles, CA and Gwinnett County, GA have determined this scan to be **useful for preventing cardiovascular events and are also cost saving.**\(^{19,20}\)

3) Irish Heart Disease Awareness' video Widowmaker (discusses evidence-base for using the CAC scan for proactive screening similar to a mammogram for the heart, but with much less frequency): [Irish Heart Disease Awareness – Heart Attacks, The Facts](https://www.heartdisease.ie/heart-attacks-the-facts/)
About the Right Care Initiative

Since 2007 The Right Care Initiative’s goal has been to apply scientific evidence and outcomes improvement strategies to reduce cardiovascular and diabetes morbidity and mortality through a collaborative focus on achieving measurable quality goals where performance metrics indicate that evidence-based, life-saving practices are not fully deployed. 2017 data from the California Office of Statewide Health Planning and Development indicate that annually approximately 298,000 Californians are hospitalized for heart attacks and strokes, approximately 100,000 of them younger than age 65. Many of these could be prevented with evidence-based preventive patient management, clinical quality improvement and adoption of best practices to implement best medical knowledge. Our work is focused in these high-leverage areas of better management of cardiovascular disease and diabetes, with particular emphasis on control of blood pressure, cholesterol and blood sugar, and is informed by data from Integrated Health Care Association, the National Committee for Quality Assurance, the federal Agency for Health Care Quality and Research, the Commonwealth Foundation, CMS, and the US Centers for Disease Control and the NIH.

The Right Care Initiative, operated by the UC Berkeley School of Public Health, was publicly launched with the Department of Managed Health Care, NCQA and the Deans of UC Berkeley and UCLA Schools of Public Health in March 2008 at the 1st annual Clinical Quality Improvement Leadership Summit. Since the first leadership summit, more than a dozen Right Care summits have been held around the state, along with over 150 monthly University of Best Practices. Each Right Care gathering is a collaborative effort to close the gap between science and practice to improve patient outcomes working with medical directors, pharmacy and quality improvement directors, as well as thought leaders in evidence-based medicine.

More information on The Right Care Initiative can be found at: https://RightCare.Berkeley.edu/

20 Project Brief produced 2017 (Updated 2019) by Cardiologists: William J. Bommer, MD, FACC (UC Davis; California American College of Cardiology); David J. Maron, MD, FACC, FAHA (Stanford University, Director of Preventive Cardiology; Clinical Prof. of Cardiovascular Medicine); Matthew Budoff, MD (UCLA Medical Center, Endowed Chair of Preventive Medicine); Eveline O. Stock, MD (UCSF Preventive Cardiology); Joseph Sky, MD, FACP, FACC (Chief of Cardiology, US Air Force David Grant Medical Center*) and Right Care Initiative Team: Hattie Rees Hanley, MPP, Right Care Initiative Director; Warren Barnes, JD, Regulatory Consultant UC Berkeley School of Public Health, Former Chief Lawyer CA Department of Managed Health Care; and Bryan Vuong, BA, UC Berkeley Research Assistant

*Dr. Joseph Sky’s views do not reflect an official position of the military.
1. In all individuals, emphasize a heart-healthy lifestyle across the life course. A healthy lifestyle reduces atherosclerotic cardiovascular disease (ASCVD) risk at all ages. In younger individuals, healthy lifestyle can reduce development of risk factors and is the foundation of ASCVD risk reduction. In young adults 20 to 39 years of age, an assessment of lifetime risk facilitates the clinician–patient risk discussion (see No. 6) and emphasizes intensive lifestyle efforts. In all age groups, lifestyle therapy is the primary intervention for metabolic syndrome.

2. In patients with clinical ASCVD, reduce low-density lipoprotein cholesterol (LDL-C) with high intensity statin therapy or maximally tolerated statin therapy. The more LDL-C is reduced on statin therapy, the greater will be subsequent risk reduction. Use a maximally tolerated statin to lower LDL levels by ≥50%.

3. In very high-risk ASCVD, use a LDL-C threshold of 70 mg/dL (1.8 mmol/L) to consider addition of non-statin to statin therapy. Very high-risk includes a history of multiple major ASCVD events or 1 major ASCVD event and multiple high-risk conditions. In very high-risk ASCVD patients, it is reasonable to add ezetimibe to maximally tolerated statin therapy when the LDL-C level remains ≥70 mg/dL (≥1.8 mmol/L). In patients at very high risk whose LDL-C level remains ≥70 mg/dL (≥1.8 mmol/L) on maximally tolerated statin and ezetimibe therapy, adding a PCSK9 inhibitor is reasonable, although the long-term safety (>3 years) is uncertain and cost effectiveness is low at mid-2018 list prices.

4. In patients with severe primary hypercholesterolemia (LDL-C level ≥190 mg/dL [≥4.9 mmol/L]), without calculating 10-year ASCVD risk, begin high-intensity statin therapy without calculating 10- year ASCVD risk. If the LDL-C level remains ≥100 mg/dL (≥2.6 mmol/L), adding ezetimibe is reasonable. If the LDL-C level on statin plus ezetimibe remains ≥100 mg/dL (≥2.6 mmol/L) and the patient has multiple factors that increase subsequent risk of ASCVD events, a PCSK9 inhibitor may be considered, although the long-term safety (>3 years) is uncertain and economic value is low at mid-2018 list prices.

5. In patients 40 to 75 years of age with diabetes mellitus and LDL-C ≥70 mg/dL (≥1.8 mmol/L), start moderate-intensity statin therapy without calculating 10-year ASCVD risk. In patients with diabetes mellitus at higher risk, especially those with multiple risk factors or those 50 to 75 years of age, it is reasonable to use a high-intensity statin to reduce the LDL-C level by ≥50%.

6. In adults 40 to 75 years of age evaluated for primary ASCVD prevention, have a clinician–patient risk discussion before starting statin therapy. Risk discussion should include a review of major risk factors (e.g., cigarette smoking, elevated blood pressure, LDL-C, hemoglobin A1C [if indicated], and calculated 10-year risk of ASCVD); the presence of risk-enhancing factors (see No. 8); the potential benefits of lifestyle and statin therapies; the potential for adverse effects and drug–drug interactions; consideration of costs of statin therapy; and patient preferences and values in shared decision-making.

7. In adults 40 to 75 years of age without diabetes mellitus and with LDL-C levels ≥70 mg/dL (≥1.8 mmol/L), at a 10-year ASCVD risk of ≥7.5%, start a moderate-intensity statin if a discussion of treatment options favors statin therapy. Risk-enhancing factors favor statin therapy (see No. 8). If risk status is uncertain, consider using coronary artery calcium (CAC) to improve specificity (see No. 9). If statins are indicated, reduce LDL-C levels by ≥30%, and if 10-year risk is ≥20%, reduce LDL-C levels by ≥50%.

8. In adults 40 to 75 years of age without diabetes mellitus and 10-year risk of 7.5% to 19.9% (intermediate risk), risk-enhancing factors favor initiation of statin therapy (see No. 7). Risk-enhancing factors include family history of premature ASCVD; persistently elevated LDL-C levels ≥160 mg/dL (≥4.1 mmol/L); metabolic syndrome; chronic kidney disease; history of preeclampsia or premature menopause (age <40 years); chronic inflammatory disorders (e.g., rheumatoid arthritis, psoriasis, or chronic HIV); high-risk ethnic groups (e.g., South Asian); persistent elevations of triglycerides ≥175 mg/dL (≥1.97 mmol/L); and, if measured in selected individuals, apolipoprotein B ≥130 mg/dL, high-sensitivity C-reactive protein ≥2.0 mg/L, ankle-brachial index <0.9 and lipoprotein (a) ≥50 mg/dL or 125 nmol/L, especially at higher values of lipoprotein (a). Risk-enhancing factors may favor statin therapy in patients at 10-year risk of 5-7.5% (borderline risk).

9. In adults 40 to 75 years of age without diabetes mellitus and with LDL-C levels ≥70 mg/dL- 189 mg/dL (≥1.8-4.9 mmol/L), at a 10-year ASCVD risk of ≥7.5% to 19.9%, if a decision about statin therapy is uncertain, consider measuring CAC. If CAC is zero, treatment with statin therapy may be withheld or delayed, except in cigarette smokers, those with diabetes mellitus, and those with a strong family history of premature ASCVD. A CAC score of 1 to 99 favors statin therapy, especially in those ≥55 years of age. For any patient, if the CAC score is ≥100 Agatston units or ≥75th percentile, statin therapy is indicated unless otherwise deferred by the outcome of clinician–patient risk discussion.

10. Assess adherence and percentage response to LDL-C-lowering medications and lifestyle changes with repeat lipid measurement 4 to 12 weeks after statin initiation or dose adjustment, repeated every 3 to 12 months as needed. Define responses to lifestyle and statin therapy by percentage reductions in LDL-C levels compared with baseline. In ASCVD patients at very high-risk, triggers for adding non-statin drug therapy are defined by threshold LDL-C levels ≥70 mg/dL (≥1.8 mmol/L) on maximal statin therapy (see No. 3).
The role of the pharmacist has evolved beyond dispensing medication into active participation in disease management and prevention. By including pharmacists on the care team, published evidence and health system experience consistently demonstrate that mortality is reduced, disease outcomes improve, healthcare costs are reduced for high-risk patients, hospital readmission rates are reduced and patients are more satisfied with their healthcare. This evidence has been demonstrated in a broad range of conditions including cardiovascular diseases, diabetes management, asthma/COPD, oncology, and psychiatry1.

### A Need for Improved Medication Management

The cost of illness and death resulting from nonoptimized medication therapy reached $528.4 billion, equivalent to 16% of total U.S. health care expenditure, in 20162. A pharmacist on the care team can help to optimize medication therapy outcomes and reduce cost.

### Five Recent Studies Bolster Evidence for Clinical and Economic Benefits of Adding Pharmacist on the Care Team

<table>
<thead>
<tr>
<th>Pharmacists Working in Los Angeles Barbershops Improved Hypertension (HTN) Control (Cedars-Sinai, California, 2018)5</th>
<th>Mortality Rate Declined Dramatically for Recently Hospitalized Coronary Artery Disease Patients (Kaiser Permanente, Colorado, 2007)9</th>
</tr>
</thead>
<tbody>
<tr>
<td>In a 2018 published NIH-funded study, a much larger percentage of patients who had their medications managed by a pharmacist in their barbershop achieved HTN control compared to those for whom the barber encouraged lifestyle modifications and regular doctor appointments. The difference in systolic blood pressure between pharmacist-managed patients and usual care was 21mmHg.</td>
<td>CAD patients receiving comprehensive cardiac care from a collaborative practice of pharmacists and nurses soon after hospital discharge were 89% less likely to die as compared to patients not enrolled in the program.</td>
</tr>
</tbody>
</table>

### Home Blood Pressure (BP) Telemonitoring and Pharmacist Management (HealthPartners Medical Group of Minnesota, 2013)6,7

Home BP telemonitors wirelessly transmitted patient measurements to clinic-based pharmacists, who then adjusted hypertensive therapy under a collaborative care agreement with physicians. This modern model of making hypertension management accessible and convenient was touted by a JAMA editorial board in 2013 as “something patients, clinicians, and policy makers can take to the bank”, like ATMs are for banking.

### Right Care Initiative Pharmacy Collaboration—University of California NIH Demonstration Project:

**Improved BP Control and Fewer PCP Visits in a Pharmacist-Primary Care Physician (PCP) Collaborative Practice11**

Drug therapy problem identified for almost 50% of patients at first pharmacist visit. Larger percentage of patients receiving care in the pharmacist-PCP collaborative practice had their BP controlled and on average had two fewer PCP visits. (UCLA School of Medicine, UCSD School of Pharmacy)

### Percent of Patients

<table>
<thead>

</tr>
</tbody>
</table>

*These data are for patients continuing to see the pharmacist through 9 months.

### Recognition of Pharmacists on the Clinical Care Team

The California Department of Public Health, U.S. Surgeon General, CDC, and Agency for Healthcare Research and Quality (AHRQ) all support the value of pharmacist on the care team interventions for proven improved quality of care and high return on investment1,3,4

### Statewide Program Reduced Hospitalizations and Avoided Millions in Cost for Older Adults (Center for Medicare & Medicaid Innovation [CMMI] Project in Hawaii, 2016)9

Medication management services provided by specially trained hospital and community pharmacists were associated with:

- 36% reduction in the medication-related hospitalization rate
- $6.6 million of avoided costs compared to the $1.8 million of program cost: a $2.61:1 return on investment.

### Insurer Based Transition of Care Program Reduced Hospital Readmissions for High Risk Patients (CVS Health, 2016)10

Recently hospitalized patients participating in a post-discharge pharmacist medication reconciliation program had a 50% relative risk reduction (11% absolute risk reduction) for hospital readmission within 30 days of discharge. The program more than paid for itself with savings of $2 for every $1 spent.
**California Right Care Initiative Project Brief: Pharmacists on the Clinical Care Team**

**Page 2**

### Additional Evidence Supporting Pharmacy Care

**Cardiovascular and Diabetes Outcomes Improve for High Risk Patients – University of Southern California (CMMI Project)**

Pharmacists providing Comprehensive Medication Management (CMM) for ~6,000 high-risk patients improved blood pressure, cholesterol management, and A1c significantly more than a propensity score-matched usual care cohort. Patient and physician satisfaction were extremely high (manuscript in preparation, 2018).

### Large Employer Cardiovascular and Diabetes Program Improved Patient Health and Reduced Costs: The Asheville Project (City of Asheville, NC)

The Asheville quasi-experimental, longitudinal cohort studies provided early evidence of pharmacist on care team benefits.

#### Ashville Cardiovascular (CV) Events and Costs:

<table>
<thead>
<tr>

#### Outcomes for Cardiovascular Pharmacy Management from Asheville Project

![Graph showing outcomes for cardiovascular pharmacy management from Asheville Project](image)

#### Outcomes for Diabetes Pharmacy Management from Asheville Project

![Graph showing outcomes for diabetes pharmacy management from Asheville Project](image)

#### Typical “Pharmacist on the Care Team” Services

- 60-minute initial patient interview and counseling session (in-person or telephone) and 20-30 minute follow up sessions
- Comprehensive review of lab results and medications (including over-the-counter medications, supplements and herbal remedies)
- Point of care testing (e.g., blood sugar, blood pressure, blood thinner monitoring), vital sign measurement, depression screening
- Assessment of patients to monitor medication efficacy and safety
- Determination of drug interactions, how to improve medication therapy, and cost savings alternatives
- Interactive communication with physician and other members of the healthcare team (optimally through the electronic medical record)

#### Questions for a Pharmacist

- Is the medication selection and dose appropriate given the patient’s age or other conditions and medications?
- Should medication therapy changes be considered that might improve patient adherence or address side effects?
- What time of day should patients take medications?
- Are there additional medications that the patient should be taking?
- With what should (or should not) a medication be taken?
- Are there less expensive, equivalent medications available?

### References

This program description was written by the California Right Care Initiative team at the University of California, Berkeley. For more information: RightCare@Berkeley.edu; (510) 642-4937. Last updated May 23, 2018.
“Home blood pressure monitoring should become a routine component of blood pressure measurement in the majority of patients with known or suspected hypertension…. [It] has the potential to improve the quality of care while reducing costs....”
Joint call to action by the American Heart Association, the American Society of Hypertension, and the Preventive Cardiovascular Nurses Association

More than 7 million California adults (about 27%) have hypertension. Approximately 69% of people who had a first heart attack, 77% who had a first stroke, and 74% of those with congestive heart failure had blood pressure greater than 140/90 mmHg. Home blood pressure monitoring is a readily accessible, evidence-based and cost-effective strategy for improving hypertension treatment and control.

Improved Health and Cost Outcomes with Home Blood Pressure Monitoring

- Home monitoring in one study reduced the medication needed for blood pressure control, saving $1198 per 100 patients per month.
- A meta-analysis of 18 randomized controlled trials found that hypertensive people using home monitoring had blood pressure 4.2/2.4 mmHg lower than those with standard office monitoring. Risk of blood pressure above target was also lower in people with home monitoring.
- Home monitoring identifies whether blood pressure is different outside the doctor’s office, which is common for as many as 20% of Americans. These patients are at higher risk for developing sustained high blood pressure (Harvard Newsletter).
- 95% of physicians agreed that home blood pressure measurements were useful in making treatment decisions to manage hypertension patients’ condition.

Home Monitoring Benefits

- Promotes better blood pressure control by engaging patients and motivating proactive behaviors—healthy eating, physical activity, proper medication use.
- Cuts healthcare costs—may reduce medications, the total number of doctor or clinic visits, and patients’ travel expenses and lost wages.
- Tracks treatment effects between doctor visits.
- Helps doctors confirm hypertension diagnosis earlier.

Blood Pressure Control among Critical Right Care Goals

- The Right Care goal for all California health plans and medical groups is to achieve the national “A grade” of performance on cardiovascular disease and diabetes prevention and treatment measures, particularly for blood pressure and cholesterol control.
- The National Committee for Quality Assurance (NCQA) estimates that controlling high blood pressure alone is estimated to save 619-1,057 lives annually and avoid $4.5 million in hospitalization costs.

Blood Pressure Control Trends:
Most California Health Plans are Making Progress

Home Monitors Increasingly Accurate and Affordable

- Machines can be purchased over-the-counter at most drugstores and pharmacies.
- Prices range from less than $50 to about $100.
- Validated machines are listed at [http://www.dableducational.org/](http://www.dableducational.org/)
- New technology is continually improving the ease and convenience of home monitoring.
Patient-Directed Blood Pressure Control with Home Monitoring

This demonstration project showed that patient participation in the control of blood pressure through home monitoring is feasible, effective, requires few extra clinic resources, and leads to better goal achievement.

Target Population

- Patients with high blood pressure and high risk for adverse cardiovascular outcomes

Intervention

- Each patient was given a blood pressure goal, a 30-60 minute educational session about blood pressure control importance, information about treatment options, and a home blood pressure monitor.
- Patients measured and recorded their blood pressure and pulse two times per day until blood pressure was at goal or after changes in treatment. Blood pressure readings were phoned/faxed/e-mailed to a clinic nurse. (Wireless versions now available make reporting even easier).
- Patients also evaluated blood pressure personally and, if not at goal, contacted clinic for instructions to improve blood pressure control.

Outcomes

- 31% of patients in the patient-directed care (home monitoring) group achieved goal in 6 months compared to 13% of patients in the usual care group.

Lessons Learned

- Physicians committed as a group to implement home monitoring when the project plan was presented at unit meetings.
- Questionnaires, blood pressure tracking sheets and educational materials helped patients better understand their blood pressure goal.

U.S. & International Guidelines Support

** Data from NCQA, prepared by the CA Office of the Patient Advocate (OPA)
The Right Care Initiative (RCI) is dedicated to improving cardiovascular and diabetes outcomes by catalyzing uptake of patient-centered, evidence-based practices using performance data to drive improvement among health systems, medical groups, clinics, and health plans. Based at UC Berkeley School of Public Health, this public-private partnership was launched in 2008 by the UC Berkeley and UCLA Schools of Public Health with encouragement from the CA Department of Managed Health Care. RCI includes health system leaders, patient groups, the University of California (multiple campuses), USC, Stanford, Health Services Advisory Group (CMS QIO), CA Chronic Care Coalition, and RAND. We collaborate intensively with local leaders in 4 major metro areas: San Diego, Sacramento, Los Angeles and Silicon Valley. Right Care’s first University of Best Practices (UBP) launched in San Diego in February of 2011; the 2nd in Sacramento 2012. UBP gathers health leaders for top performers to teach proven strategies, practices, and breakthrough ideas to prevent heart attacks, strokes, and diabetic complications.

---

**University of Best Practices: Right Care’s Translational Model to Implement Evidence-Based Innovations**

- Monthly 2-hour convenings are held with leaders from the major regional health care delivery systems in each region.
- Leaders from successful organizations or experts present for 1 hour.
- A break-out session or discussion involving all participants follows in the second hour to consider how to apply the speaker’s ideas in the local setting and to problem-solve how to overcome barriers to better uptake of evidence-based protocols and practices.
- Trusted performance data are the bedrock of the UBP model.

**Key Statistics**

- Mortality rates in Sacramento County for diabetes, coronary heart disease, and stroke are higher compared to the state. Figure 1.
- Sacramento has higher hospitalization rates for acute myocardial infarction (MI) and stroke compared with California overall (OSHPD).
- Sacramento County has the 2nd worst rate of MIs in CA.
- There are large disparities by race for cardiovascular hospitalizations and risk factors. Figs. 5, 6 and 8.
- Many counties are leading Sacramento on lowering risks. Table 1.

Proposed Action Plan for Sacramento County

Sacramento County has:

- **Higher rates of smoking than the state average**
  - Encourage primary care physicians to ask about smoking as a vital sign during every visit.
  - Provide brief cessation counseling for smokers which also helps meet meaningful use¹.

- **Higher rates of obesity than the state average**
  - Encourage measurement of BMI regularly in primary care; ensure patients are aware of obesity-related health risks².
  - Develop a plan with patients for addressing obesity; provide solid evidence to promote diet and physical activity changes.
  - Work to ensure all communities have access to safe, affordable options for healthy diets and physical activity in their neighborhoods.³

- **Higher rates of hypertension than the state; high rates of uncontrolled hypertension, especially for African Americans**
  - Improve community outreach about hypertension as a silent killer.
  - Improve medication adherence by utilizing health coaches to activate patients via motivational interviewing and evidence-based media messaging.
  - Provide information about best practices for treating hypertension to local primary care providers.
  - Ensure that physicians are made aware of the most recent medication protocols and guidelines for hypertension and guidelines are actively being upheld by all care team members.

- **Disparities in self-reported hypertension, smoking, and obesity exist among different race/ethnicities in Sacramento County**
  - Utilize health coaches for evidence-based patient education and motivational interviewing on nutrition and physical activity and for counseling on smoking cessation.
  - Use culturally aligned, linguistically appropriate health coaches to bridge the gaps.
  - Ask your patients about social determinants of health including whether medication costs are within budget.

Other Interventions may include:

- Clinical pharmacists on the care team to integrate comprehensive medication management to improve quality of health care.
- Community-based screenings, patient education, and referrals into care, such as in faith-based settings and barbershops to "meet patients where they are."
- Referring smokers to tobacco tax funded smoking cessation programs.
- Creating a public messaging campaign such as on bill-boards and on social media to encourage patients to adopt healthy lifestyles such as 30 minutes of walking a day, and moving to a plant-centric eating pattern.
- Adopting culturally appropriate messaging to enhance education for high risk populations.

Deploy evidence-based, culturally appropriate video training materials for high risk patients and their families to be prescribed before an appointment of motivational interviewing. High risk patients & families need to learn the importance of home blood pressure monitoring, that time is of the essence when CVD symptoms strike, and to call 911 rather than self transport to ensure prompt treatment at a hospital with capacity to treat quickly.

Bibliography

### Recommended Lifestyle Changes for Hypertension Management 2017

**Distributed by Clinicians Group Capital Region Right Care Initiative**

#### Lifestyle Changes for Hypertension Control

<table>
<thead>
<tr>
<th>Modification</th>
<th>Recommendation</th>
<th>Approximate SBP Reduction (Range)*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reduce Weight</td>
<td>Maintain normal body weight (body mass index 18.5–24.9 kg/m²)</td>
<td>5–20 mmHg/10 kg</td>
</tr>
<tr>
<td>Adopt DASH eating plan</td>
<td>Consume a diet rich in fruits, vegetables, and low-fat dairy products with a reduced content of saturated and total fat</td>
<td>8–14 mmHg</td>
</tr>
</tbody>
</table>
| Lower sodium intake   | a. Consume no more than 2,400 mg of sodium/day;  
b. Further reduction of sodium intake to 1,500 mg/day is desirable, since it is associated with even greater reduction in BP;  
c. Reduce sodium intake by at least 1,000 mg/day since that will lower BP, even if the desired daily sodium intake is not achieved | 2–8 mm Hg                         |
| Physical activity     | Engage in regular aerobic physical activity such as brisk walking (at least 30 min per day, most days of the week) | 4–9 mm Hg                         |
| Moderation of alcohol consumption | Limit consumption to no more than 2 drinks± (e.g., 24 oz beer, 10 oz wine, or 3 oz 80-proof whiskey) ±± per day in most men, and to no more than 1 drink per day± (e.g., 12 oz beer, 4-5 oz wine, or 1.5 oz 80-proof whiskey) ±± in women and lighter weight persons | 2–4 mm Hg                         |
| Tobacco cessation     | Use Motivational Interviewing (MI) techniques versus usual care for smoking cessation to demonstrate a significant increase in quitting. MI delivered by primary care physicians nearly 4 times more effective than usual care but delivery by counselors closer to 1.25 (still a significantly higher quit rate than usual care). | 0–5 mm Hg                         |

Page 28 of 35
Heart disease and stroke still account for 26% of deaths among Santa Clara county residents, despite strong local progress in the past 15 years across the state and Santa Clara County, and remain the #1 and #5 killers nationally. Given Santa Clara County’s substantially lower death rates than the rest of the state from Strokes and Heart Attacks, combined with a critical mass of resourceful innovators, Santa Clara County and the SF Bay Area region have the unique opportunity to show what is possible in pressing Towards Zero Preventable Heart Attacks, Strokes, and Diabetes Deaths & Disabilities. Focused, collaborative efforts to address clinical performance gaps among delivery systems and medical groups for the critical risk factors of control of cholesterol, blood pressure and blood sugar can reduce risk of death and disability from strokes, heart attacks and diabetes. In addition to managing these cardiovascular indicators among patients already engaged with the health care system, we must redouble our efforts to find and treat the vulnerable through proactive screening and outreach to help close the disparities in cardiovascular health that exist particularly for high risk racial and ethnic groups such as African Americans and those from India/South Asia.

Project Brief produced January 21, 2019, by Right Care Initiative Team: Hattie Rees Hanley, MPP, Right Care Initiative Director; Susan L. Ivey, MD, MHSA Professor, Adjunct, UC Berkeley, School of Public Health, and Director of Research, Health Research for Action; Bryan Vuong, BA, UC Berkeley Research Assistant
South Asians and Cardiovascular Disease: An Overview

Background:
The term South Asian (SA) denotes persons whose countries of origin include India, Pakistan, Nepal, Bangladesh, Sri Lanka, and other countries in the region. South Asians have experienced significant population growth in the U.S. (increasing 81% from 2000-2010 alone). South Asians are at high risk of coronary artery disease (CAD) and mortality compared to other ethnic groups, and exhibit higher rates of premature CAD. The risk profile for this group can be attributed to both upstream risk factors such as urbanization and globalization, and physiological risk factors such as higher rates of diabetes and hypertension, lower levels of physical activity, and central distribution of weight. Though South Asian Americans don’t possess unique risk factors for cardiovascular disease, the group is experiencing high prevalence of specific CVD risk factors.

Mediators of Atherosclerosis in South Asians Living in America Study: The MASALA study is the first longitudinal cohort study of U.S. South Asians seeking to understand unique factors leading to CAD in South Asians. South Asian men and women (n=906) were recruited from 2 clinical sites: UCSF and Northwestern University. Results from MASALA, such as high rates of diabetes, lipid abnormalities, and low PA will inform treatment and prevention for South Asians.

Leading Causes of Mortality in California’s South Asians:
A study evaluating the leading causes of mortality in Asian Indians in California found cardiovascular diseases to be the leading cause of death for both males and females. Almost half of all deaths for Asian Indian males in this study were due to cardiovascular disease. In this same study, the number of deaths due to diabetes, a major risk factor for heart disease, increased with age for both Asian Indian men and women.

Works Cited
Risk Factors for Heart Disease include:

- **Hypertension**: Studies show high incidence of hypertension in South Asian Americans\(^6\), and increased incidence of hypertension in South Asians who immigrated to Great Britain compared to native South Asians.\(^5\) One of the most common CVD risk factors among South Asians in the U.S. is hypertension, with a prevalence of 43% in men and 35% in women.\(^3\)

- **Diabetes**: One study found the prevalence of Type 2 diabetes (T2DM) to be 24% among South Asians in India, with incidence continuing to rise.\(^6\) South Asians in MASALA had age-adjusted rates of T2DM of 23%, higher than for other U.S. groups,\(^7\) and high levels of insulin resistance, a risk factor for T2DM.

- **Lack of Exercise**: Regular physical activity can decrease one’s risk of cardiovascular disease and diabetes, however South Asians in the MASALA cohort had low rates of physical activity compared to other groups.\(^7\) South Asian immigrants exhibit a more sedentary lifestyle on immigration to Western countries.\(^8\)

- **Obesity**: South Asians require lower BMI cutoffs than standard to assess heart disease risk, with >23 kg/m\(^2\) being overweight, and >27.5 kg/m\(^2\) categorized as obese.\(^9\) When these standards are applied to MASALA, 33% of the cohort scored as “poor” in meeting the Asian American BMI standard.\(^10\)

- **Poor Diet**: South Asians who migrate to Western countries report an increased consumption of fats and decreased consumption of fiber.\(^11\) Dietary patterns can increase hypertension in South Asians.\(^12\)

- **Stress**: Anxiety and depression in SA men and stress in SA women in the MASALA study were associated with thicker artery walls (carotid intima-media thickness),\(^13\) a marker for sub-clinical coronary artery disease.

- **Tobacco Use**: Studies show that while smoked tobacco is relatively low, cultural tobacco products such as paan and beedis are used among South Asians and can increase one’s risk of a heart attack.\(^14\)

### Next Steps

1. Continue data collection in this high risk group via adequately funded longitudinal and clinical trials.
2. Undertake culturally-tailored outreach in SA communities. Create culturally-relevant education materials in common SA languages, such as Hindi, Punjabi, Bangla, and Urdu. Develop effective interventions.
3. Ensure physicians are aware of the unique risks SA individuals have for heart disease and diabetes, so they can better screen and educate their patients.
4. Incorporate race, ethnicity, and country of origin in studies of lipids and genetic markers for lipid abnormalities.

Hospitalizations for Diabetes-Related Leg Amputations

Data Source: Office of Statewide Health Planning and Development (2016 Dataset)
Draft as of 9/24/17; Formal brief to be completed once more data becomes available

Lower Extremity (LE) Amputations in Diabetes – While diabetes mellitus has many consequences, one particularly complex one is the impact on the lower extremity, ranging from chronic non-healing ulcers which affect more than 10% of people with diabetes annually, to chronic and acute infections (including gangrene), to accelerated peripheral vascular disease. All of these can lead to the need for amputations, ranging from the toe to the above knee amputation. Loss of mobility is but one of the serious consequences that follows what can become a series of costly hospitalizations for complex surgeries. Better treatment of diabetes may decrease rates of amputations, improving mobility and quality of life for people living with diabetes. As a first look at this problem in California, the Right Care Initiative used existing data from the 2014 and 2016 Office of Statewide Health Planning and Development Datasets. Below we provide a snapshot of the number of Californians who are impacted by these serious sequelae of diabetes, including looking specifically at those in Sacramento County. Sacramento County has higher rates of diabetes reported in state surveys.

Figure 1: Diabetes-related Lower Extremity Amputations in California by Counties

Figure 2: Diabetes-related Lower Extremity Amputation rates per 100,000 in California and selected counties

Figure 3: Self-reported diabetes (Type I and II) from 2011-2014 publicly available data (California Health Interview Survey)

Figure 4: Self-reported diabetes by race from 2013-2014 publicly available data (California Health Interview Survey)
Diabetes-Related LE Amputations in California - percent in group - Age (2016)

- Under 50: 36.7%
- 50 to 64: 45.8%
- 65+: 17.5%

Diabetes-Related LE Amputations in Sacramento County Percent in group - Age (2016)

- Under 50: 35.9%
- 50 to 64: 46.5%
- 65+: 17.6%

Diabetes-Related LE Amputations in California - percent in group - Race/Ethnicity (2016)
